

ACTIVITY 2 — FACILITATOR GUIDE**PESTLE and TECOP External Environment Scan**

TYPE	DURATION	MAPS TO	TOPIC
Workshop	75 minutes	LO4	1 - Business Environment

Purpose of this activity

By the end of this activity learners will be able to run a structured PESTLE scan of the environment surrounding the Contoso Training Portal Upgrade.

What learners produce

pestle scan, tecop scan, backlog impacts — submitted to artifacts/.

Materials required

- Learner Worksheet (one per learner)
- Checklist (one per group)
- Laptop with internet access for the live problem-solving tools
- The course slides for the framework and worked example

Set-up

Groups of 3 to 4. Distribute one worksheet per learner and one checklist per group; each group needs one laptop for the calculations.

Scenario / briefing material

Contoso Learning Pte Ltd is a training provider with 14,000 active learners. Its course registration portal is 9 years old. Registration takes a median of 11 minutes and 34% of attempts are abandoned. Learner communications consume 24 staff-hours per week across 3 administrators. 62% of learner traffic is mobile, against a portal that is not responsive. Legacy consent screens do not meet current PDPA requirements. The project modernises course registration and learner communications.

How to run it — step by step

#	Instruction to learners	Facilitator note
1	Read the environment briefing	Check the arithmetic on one group's numbers before moving on — a wrong sign propagates into every later step.
2	Build and score the PESTLE table. Create artifacts/02-pestle-scan.md. For each of the six categories, record at least one factor. Score impact 1-5 and likelihood 1-5, then compute Score = Impact x Likelihood.	Make a group state the UNITS and the base date. Most errors here are unit errors, not maths errors.
3	Run the TECOP scan. PESTLE looks outward at the market. TECOP looks at the *risk dimensions of the project itself* and catches things PESTLE misses - particularly operational and organisational exposure.	Have one group present a single row rather than the whole artifact — depth over coverage.
4	Rank and take the vital few. Combine both tables, sort by score descending, and take everything scoring 16 or	Check the arithmetic on one group's numbers before moving on — a wrong sign propagates

	above.	into every later step.
5	Translate factors into scope and backlog consequences. This is the step most people skip, and it is the step the ECO actually assesses. A scan that changes nothing is decoration. Create artifacts/02-backlog-impacts.md:	Make a group state the UNITS and the base date. Most errors here are unit errors, not maths errors.
6	Set the review cadence. ECO Business Env T8 says "**continually* review the external business environment for impacts". Define who looks, when, and what triggers an out-of-cycle review.	If a group finishes early, ask what changes at twice the scale or half the budget.
7	Answer the exam-style scenarios	Check the arithmetic on one group's numbers before moving on — a wrong sign propagates into every later step.

Suggested timing

Minutes	Phase
8 min	Brief the scenario, confirm the inputs and assign roles
28 min	Work the first half of the steps individually, then pool as a group
28 min	Complete the remaining steps and finalise the deliverable
11 min	Group share-back, facilitator debrief and exam-style linkage

Total: 75 minutes

Discussion & decision prompts

1. Run a structured PESTLE scan of the environment surrounding the Contoso Training Portal Upgrade — how did your group decide, and what would change that decision?
2. Run a TECOP scan to surface risk dimensions PESTLE tends to miss — how did your group decide, and what would change that decision?
3. Score each factor for impact and likelihood, and rank them — how did your group decide, and what would change that decision?
4. Every PESTLE letter (P, E, S, T, L, E) has at least one factor; a scan missing a category is not a PESTLE scan — can every member of your group defend it?
5. Where would pestle and tecop external environment scan have saved you time or money on a real project you have worked on?

What good looks like

- Every PESTLE letter (P, E, S, T, L, E) has at least one factor; a scan missing a category is not a PESTLE scan.
- Every score is the product of impact and likelihood, and you can state both numbers for any factor.
- Your TECOP table surfaced at least one factor that does not appear anywhere in your PESTLE table. If the two tables are identical, you used PESTLE twice.
- Every factor scoring 16+ has a named destination artifact in a later lab - not a vague "monitor".
- Your cadence names an owner, a frequency, and at least three out-of-cycle triggers.
- In Scenario 1 you chose B and can explain why "add to risk register and continue" is wrong for an event that has already happened.
