Self-check — Requirements Elicitation, Mind Mapping and the Traceability Matrix

Tick each item you have completed. Any blank is a gap to close before your group presents at the debrief.

#	Criterion	Evidences	✓
1	Every non-functional requirement in your register contains a number and a measurement method. If any NFR reads "fast", "reliable" or "user-friendly", it is not finished.	LO1	
2	Every requirement has an acceptance criterion that could be handed to a tester who was not in the room.	LO1	
3	You used observation rather than interviews for the admin staff, and you can state why.	LO1	
4	Your register contains at least three transition requirements. If it has none, you have confused the product with the project.	LO1	
5	Your RTM traces in both directions, and you can demonstrate an impact analysis by naming every downstream artifact affected by a change to REQ-018.	LO1	
6	You computed a compliance coverage fraction as a number, found it was below 13/13, and drafted the requirements to close the gap - rather than assuming coverage.	LO1	
7	You can state what happens to a requirement after baseline and what does not require a change request in the hybrid model.	LO1	
8	No requirement in your register specifies a technology choice unless a named stakeholder genuinely requires that technology.	LO1	

Debrief check

Every non-functional requirement in your register contains a number and a measurement method. If any NFR reads "fast", "reliable" or "user-friendly", it is not finished.

Feedback

What did you find hardest in this activity?

What is the ONE thing you will do differently at work?
