

ACTIVITY 16 — FACILITATOR GUIDE**Tuckman Diagnosis, Motivation Theory and Leadership Style**

TYPE	DURATION	MAPS TO	TOPIC
Workshop	75 minutes	LO3	4 - Lead the Project Team

Purpose of this activity

By the end of this activity learners will be able to diagnose a team's Tuckman stage from observed behaviour rather than from elapsed time.

What learners produce

tuckman diagnosis, motivation plan, leadership style plan — submitted to artifacts/.

Materials required

- Learner Worksheet (one per learner)
- Checklist (one per group)
- Flipchart or A3 sheet and markers
- Laptop with internet access for the live problem-solving tools
- The course slides for the framework and worked example

Set-up

Groups of 3 to 4. Distribute one worksheet per learner and one checklist per group; each group needs one laptop for the calculations.

Scenario / briefing material

Contoso Learning Pte Ltd is a training provider with 14,000 active learners. Its course registration portal is 9 years old. Registration takes a median of 11 minutes and 34% of attempts are abandoned. Learner communications consume 24 staff-hours per week across 3 administrators. 62% of learner traffic is mobile, against a portal that is not responsive. Legacy consent screens do not meet current PDPA requirements. The project modernises course registration and learner communications.

How to run it — step by step

#	Instruction to learners	Facilitator note
1	Read the sprint 3 evidence. Create artifacts/16-tuckman-diagnosis.md. Read the narrative below and record only what you observe. Do not label the stage yet.	Keep role-holders in role; learners drift to consensus. Push for the concern behind the stated position.
2	Diagnose the stage and name the structural causes	If the room agrees too quickly, take the quietest role aside and give them one more constraint.
3	Choose the leader actions for storming. The stage determines the action. A directing response to a storming team escalates it; a delegating response abandons it.	Debrief on what was conceded and why — the trade, not the outcome, is the learning.
4	Apply the six motivation theories. Worked Herzberg example, because it is the most-tested distinction on the	Check the arithmetic on one group's numbers before moving on — a wrong sign propagates

	exam:	into every later step.
5	Build per-member motivation profiles. Every action in that table is free or nearly free. That is the point of doing the diagnosis: motivation interventions that cost money are usually aimed at the wrong factor.	Make a group state the UNITS and the base date. Most errors here are unit errors, not maths errors.
6	Map situational leadership style to each member. Create artifacts/16-leadership-style-plan.md. Style is set by the member's competence AND commitment ON A SPECIFIC TASK - not by their seniority and not by your preference.	Ask for one item the group nearly dropped and what made them keep it.
7	Servant leadership, and how it differs from laissez-faire	Keep role-holders in role; learners drift to consensus. Push for the concern behind the stated position.
8	Answer the exam-style scenarios	Make a group state the UNITS and the base date. Most errors here are unit errors, not maths errors.

Suggested timing

Minutes	Phase
8 min	Brief the scenario, confirm the inputs and assign roles
28 min	Work the first half of the steps individually, then pool as a group
28 min	Complete the remaining steps and finalise the deliverable
11 min	Group share-back, facilitator debrief and exam-style linkage

Total: 75 minutes

Discussion & decision prompts

1. Diagnose a team's Tuckman stage from observed behaviour rather than from elapsed time — how did your group decide, and what would change that decision?
2. Select the leader action that actually moves a team out of the stage it is in — how did your group decide, and what would change that decision?
3. Apply six motivation theories to named individuals and produce a specific action from each — how did your group decide, and what would change that decision?
4. Your Tuckman diagnosis cites specific observed behaviours and never uses elapsed time as evidence — can every member of your group defend it?
5. Where would tuckman diagnosis, motivation theory and leadership style have saved you time or money on a real project you have worked on?

What good looks like

- Your Tuckman diagnosis cites specific observed behaviours and never uses elapsed time as evidence.
- You can state why the team is storming rather than norming in one sentence, and it refers to who enforces the ground rules.
- Your structural causes are things the PM owns. If your causes list says "Rajesh is difficult" or "Farah is disorganised", redo it - you have diagnosed people where the evidence points at process and capacity.
- None of your leader actions has the PM deciding the architecture or overruling the definition of done.

- Your Herzberg example predicts that the pay rise produces approximately no change, and names at least three motivators that would.
- Your Vroom calculations are multiplicative, and you have demonstrated numerically that fixing the wrong factor barely moves the score.
- At least one team member appears at two different situational-leadership levels for two different tasks, and you can explain why one style per person is wrong.
- Your servant-leadership section names what the leader DOES. If your description of servant leadership would also describe a leader who did nothing, rewrite it.
