Date	

Self-check — SPC Control Chart and Statistical Process Analysis

Tick each item you have completed. Any blank is a gap to close before your group presents at the debrief.

#	Criterion	Evidences	✓
1	Your centre line is 4.053, MR-bar is 0.3286, sigma is 0.2913, and your limits are 3.179 and 4.927. If your limits are much wider, you computed them across all 20 points and have hidden the signal.	LO5	
2	You used MR-bar / 1.128 to estimate sigma, not the sample standard deviation. Using the sample SD of the stable period (0.2066) would give limits of 3.43 to 4.68 - narrower, and not the standard individuals-chart method.	LO5	
3	You checked the rule of seven explicitly on days 1-15 and found the longest run to be 2, concluding no violation. Simply asserting "no rule violations" without the run analysis is not the check.	LO5	
4	You identified days 16-20 as assignable cause AND named a specific, dated, plausible cause with a magnitude that matches the observed shift.	LO5	
5	You stated that days 1-15 were in control and still failed the specification. If your verdict is "the process was fine until day 16", you have missed the central point of the lab.	LO5	
6	Your Cpk is negative, and you concluded that the process must be re-centred rather than merely tightened.	LO5	
7	Your action list addresses both the assignable cause and the underlying capability problem, and your post-action forecast is stated honestly rather than claimed as capable.	LO5	
8	You can explain why demanding an explanation for a single below-average day in a stable process makes performance worse.	LO5	

Debrief check

Your centre line is 4.053, MR-bar is 0.3286, sigma is 0.2913, and your limits are 3.179 and 4.927. If your limits are much wider, you computed them across all 20 points and have hidden the signal.
